VIT ships newest international Under-Vehicle-Surveillance-System

Sterling, VA. — Jan. 9, 2004 — Vehicle Inspection Technologies, a security products manufacturing firm based in Sterling, VA, today announced first deliveries of their newest “Und-aware” UVSS 400 series product line to KSA.

The export manager at the manufacturing facility expressed satisfaction on VIT's successful shipments to the Kingdom of Saudi Arabia where many of the product's features will prove especially useful. He stated that the customers were excited about the patented AirWash™ system, which is designed to for automatic lens cleaning that will remove the ever-present blowing dust and sand from the cameras and lights allowing clear vehicle inspection no matter what the weather.

“The first challenge I faced in developing a truly usable UVSS was to make a system that worked no matter what the weather!” said Bill Peterson, Undaware™ designer and company President. “The new 400 series product family now clears both camera and light lenses ensuring even better images.”

Weather in Saudi can cause undue strain on components that already run “hot.” For this reason, the “cool” white LED lights with a lifetime of up to 100,000 hours will really keep maintenance to a minimum, a real concern to the Saudi's who lack convenient local sources for many service items.

Vehicle Inspection Technologies is part of a 1972 corporation started by William Peterson, designer of myriad specialty security products for government and industry. The Und-aware™ product family includes above and below-ground, fixed and portable systems ranging from two to 8-cameras to scan the full width of any size vehicle. Constantly upgraded product information is available from their web site at: www.undaware.com
