VIT delivers new generation Under-Vehicle-Surveillance-System to select government customers.

Sterling, VA. — March 12, 2004 — Vehicle Inspection Technologies, a security products manufacturing firm based in Sterling, VA, today announced first deliveries of their newest “Und-aware” UVSS portable product line to select government clients.

Among first domestic shipments of the new 400 series products were several systems to the US Air Force who took delivery in the rapidly deployable ATA case configuration. A Quality Control Officer at the manufacturing facility remarked that the system is rugged and dependable and these cast aluminum systems can withstand the rough treatment the system may be subjected to in operational scenarios.

“This is heavy!” said an Air Force security person as he picked up one of the cast aluminum base assemblies. “Rugged cast aluminum construction is just one way the Und-Aware™ product family distances itself from the competition,” offered company president Bill Peterson who was there to oversee the training. “A little extra weight means a much stronger product which is why we have never experienced a structural failure of a single cast aluminum part.”

Vehicle Inspection Technologies is part of a 1972 corporation started by William Peterson, designer of myriad specialty security products for government and industry. The Und-aware™ product family includes above and below-ground, fixed and portable systems ranging from two to 8-cameras to scan the full width of any size vehicle. Constantly upgraded product information is available from their web site at: www.undaware.com.
