

Und-Aware™ Software Capability:

Capture Under-the-Vehicle Information, correlate it with the License plate number and store in the database.

The user has the capability to look at the images frame-by-frame, enhance them for further detail, stop, pause, plus forward and rewind the images.

The user can view every "Nth" frame, and enable or disable certain cameras as required.

The user can retrieve the images for further analysis at a later time and date, by using the integrated viewer and reporting tool.

The system will record the License Plate image and the Driver image tagged with the Under-the-Vehicle image.
